SARAN M

Backend-focused Full Stack Developer | Bengaluru | +91 6379710438 | saranmvdm@gmail.com

SUMMARY

Backend-focused full stack engineer with production experience at healthtech startups, building NestJS/TypeScript REST APIs, PostgreSQL and Redis-backed services, queue-driven async pipelines (BullMQ) and AWS infrastructure for a HIPAA-compliant platform. Owns features end to end, from API and data design through CI/CD and deployment, and works across Next.js/React front ends. Building a multi-channel SaaS product for SMB sellers on the side.

TECHNICAL SKILLS

Languages: JavaScript (ES6+), TypeScript, SQL, HTML, CSS

Backend: Node.js, NestJS, RESTful APIs, asynchronous programming, OAuth2 / SMART on FHIR, JWT auth, webhooks

Frontend: React, Next.js, Electron

Data & Queues: PostgreSQL, Redis (caching, distributed locks), BullMQ, SQLite, Supabase

Cloud & DevOps: AWS (ECS Fargate, RDS, ALB, VPC, S3, KMS, SES, ACM, Config), GCP Cloud Run, Docker, LocalStack, GitHub Actions CI/CD, Git

Fundamentals: Data Structures & Algorithms, OOP, Design Patterns (Adapter, Strategy), AI-assisted development

EXPERIENCE

Software Engineer — Synapsis Medical Technologies Jul 2025 – Present

Software Engineer Intern (Apr 2025 – Jun 2025) · Bengaluru · HIPAA-compliant healthtech platform

- Designed the patient authentication system in NestJS: 15-minute access tokens, sliding refresh-token expiry, per-device revocation and a grace window to safely handle concurrent refresh replays.
- Built webhook-first ingestion for wearable health data (Terra) with BullMQ workers, decoupling receipt from processing so bursts of events are handled reliably and asynchronously.
- Implemented SMART on FHIR OAuth2 (confidential client) integration with Medplum, with per-clinic credential storage to support multiple tenant clinics.
- Provisioned the AWS pre-production environment inside the existing VPC (subnets, security groups, ALB listener rules, ACM certificates, ECS Fargate service); contributing to AWS Config HIPAA conformance remediation.
- Executed a soft-to-hard delete migration across Admin, Clinic, Patient and Dependent models, and set up LocalStack (SES, KMS, IAM) with a bootstrap script for reproducible local AWS development.
- Built GitHub Actions CI/CD for the Electron/Next.js desktop app: arm64/x64 macOS builds, notarization with a retry wrapper for arm64 timeouts, OIDC-based AWS auth and S3 artifact publishing.

Software Engineer Intern — MyCLNQ Health Jul 2024 – Mar 2025

- Contributed to backend development, debugging and feature delivery for a healthtech platform while working in an agile team.

PROJECTS

VendPilot — Multi-channel Inventory Sync SaaS Side project

NestJS · Next.js · BullMQ · Redis · Turborepo

- Building a SaaS that keeps stock in sync across Shopify, WooCommerce and Etsy for SMB sellers, using a PlatformAdapter interface (Adapter pattern) so new channels plug in without changing core sync logic.
- Designed onboarding as a BullMQ parent-child job flow (webhook registration → catalog → locations → stock import) with Redis distributed locking to prevent conflicting concurrent stock writes.
- Implemented Etsy PKCE and Shopify OAuth flows and webhook routing; migrated the codebase to a Turborepo + pnpm monorepo.

EDUCATION

B.Tech, Information Technology — CSI College of Engineering (Anna University) 2021 – 2025

CGPA: 7.70
